FINE CYCLO® High Precision Gearboxes

DA series

The built-in high-load type angular contact ball bearings, which have a long working point distance, are compact and can receive a large moment load.

High allowable moment

FINE CYCLO® gearboxes were created and developed by Sumitomo. This unique reducer structure without teeth (trochoid tooth profile*) is being used in industrial robots and transfer devices all over the world. The DA series, developed for non-backlash, has three smooth cycloid discs arranged in a well-balanced manner, and a large number of simultaneous meshing provides a highly rigid and compact structure.

High torque & compact

* Epitrochoid parallel curves

Main bearing
(angular contact ball bearings)

Noise reduction

Noise reduction is realized by adopting a new tooth profile.

Cycloid disc

Eccentric high speed shaft
(high speed shaft)

Output flange
(slow speed shaft)

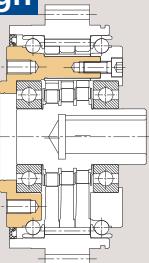

Single-stage reduction mechanism

The DA series has a single-stage reduction mechanism, so has a small number of parts and is excellent in cost performance.

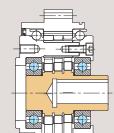

Ring gear housing

Higher flexibility of design

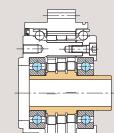

The output flange surface is flat, expanding the design flexibility of the connection surface with the customer's device, and the sealing property is secured.

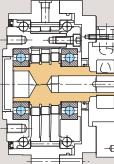

Reduction and customization of assembly steps

With key way

Hollow penetration

Keyless

The eccentric high speed shaft (high speed shaft) to which the servomotor shaft is inputted is supported inside, so motor connection is easy.

There are a lot of variations on the input side, so users can customize the FINE CYCLO to suit their needs. Contact our factory for optional parts.

With key way	Standard
Keyless hollow penetration	Option

Expanded Model Lineup

The lineup of the DA series is significantly expanded.
The most suitable model can be selected for the user's device.

Newly added

Increased Allowable Peak Torque

The DA series adopts a new tooth profile, and achieves a significant torque increase by increasing the bearing capacity and the strength of each part.

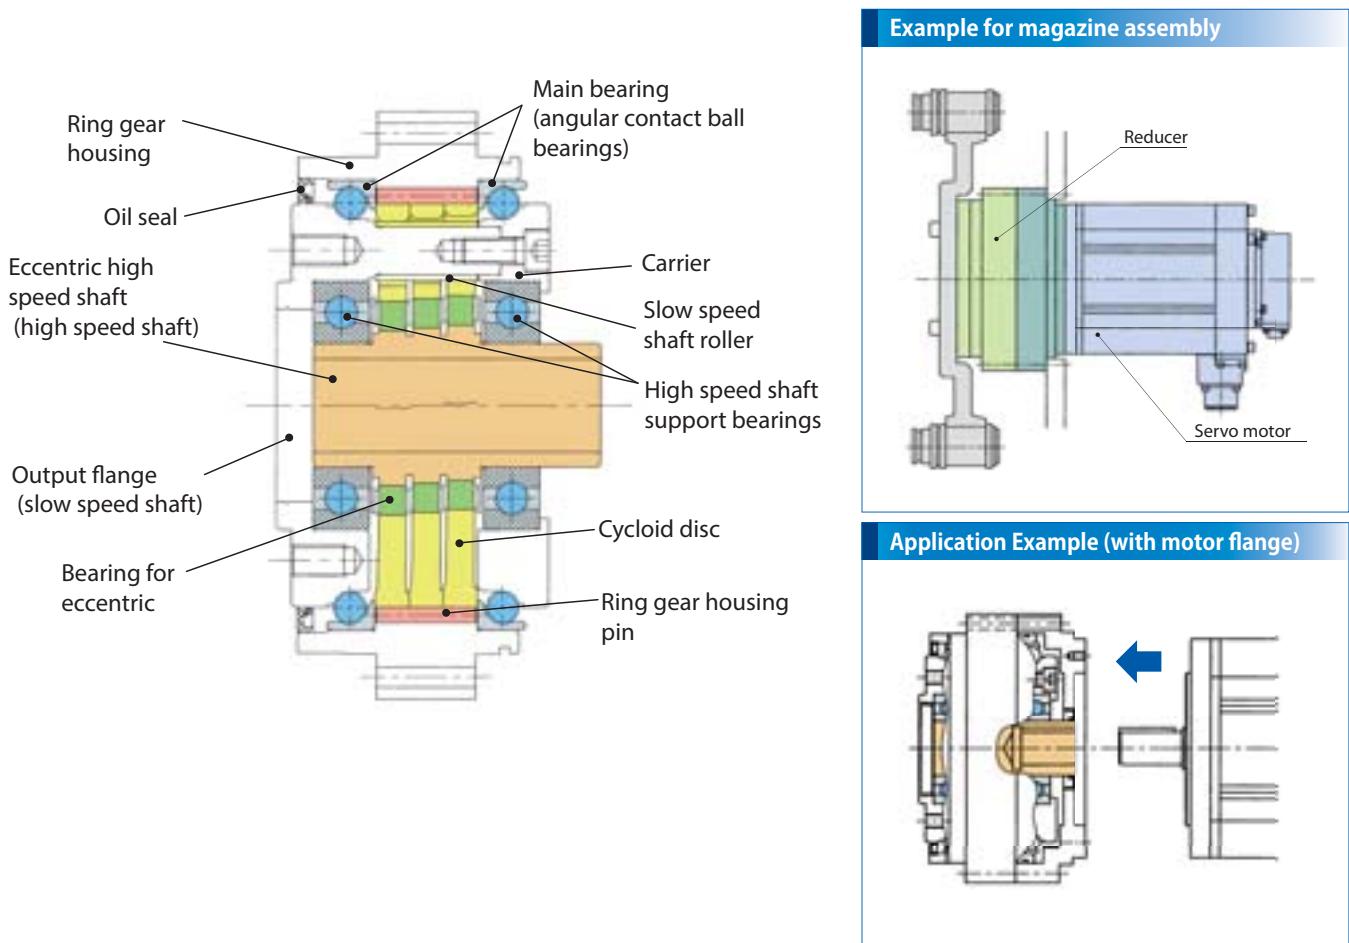

Allowable Peak Torque [N·m]

Note: Comparison of frames having the same size.
DA45 is a newly added frame size.

5. Speed Ratio and Rotation Direction

The rotation direction and speed ratio are as illustrated in Figure 2 depending on the fixed, input, and output locations.

Figure 2

6. Standard Specifications

Lubrication	Grease lubrication No grease is filled before shipment from the factory. Be sure to prepare the recommended grease and fill the reducer with it before use. For details, see 11-4 "Lubrication".	
Ambient conditions	Ambient temperature	-10 to + 40°C (Start failure may occur depending on the speed and torque of the motor in use, so consult us if the reducer will be used at about -10 to 0°C.)
	Ambient humidity	85% or less. No condensation.
	Altitude	1000m or lower
	Atmosphere	Free from corrosive gas, volatile gas or steam. Dust-free and well-ventilated area.
	Mounting location	Indoor (Free from dust, water, other liquids) - Mounting in conditions other than the above requires adherence to special specifications. Please consult with us. - Mount in a location that enables easy operation, such as inspection and maintenance. - Mount on a sufficiently rigid member.
Mounting direction	The grease quantity varies according to the mounting direction.	
Painting	Paintless

: 50%ED Use range : 100%ED Use range

Note: 1. Rated output torque

The rated torque indicates the allowable output torque at the output flange.

The rated torque for an input speed of 600 r/min or less with a reduction ratio of 41 to 119 is the same as the rated torque at 600 r/min. The rated torque for an input speed of 435 r/min or less (output speed of 15 r/min or less) with a reduction ratio of 29 is the same as the rated torque at 435 r/min (output speed of 15 r/min).

The input capacity is the required input capacity for 100% rated output torque. This value takes into account the efficiency when using the FINE CYCLO as a reducer.

2. Maximum allowable input speed and allowable average input speed (Table 1).

Although use is possible within the range of the maximum allowable input speed, the allowable average input speed is limited by the operation cycle (% ED).

See P17 Formula 10 for % ED.

3. Allowable peak torque at acceleration and deceleration (Table 2)

Allowable peak torque tolerance applied to the output flange during normal start and stop.

4. Allowable maximum momentary torque (Table 2)

Allowable maximum momentary torque applied instantaneously to the output shaft due to emergency stop, external heavy shock, etc.

This indicates the value in the case of 10^3 times of application during the entire lifetime.

5. Moment of inertia (Table 1)

Indicates the value of the moment of inertia on input shaft (high speed shaft) of each model. When converting these values to inertia (kgf.m.sec^2), divide by g (9.8 m/sec²).

6. Use the following formula to complement the rated torque for speeds not shown in the table.

$$T_N = T_{15} \left(\frac{15}{N} \right)^{0.3}$$

T_N: Rated torque for output speed N
T₁₅: Rated torque for output speed 15 r/min

: 50%ED Use range : 100%ED Use range

Note: 1. Rated output torque

The rated torque indicates the allowable output torque at the output flange.

The rated torque for an input speed of 600 r/min or less with a reduction ratio of 41 to 119 is the same as the rated torque at 600 r/min. See P8 Table 1 for the rated torque for an input speed of 435 r/min or less at the reduction ratio 29.

The input capacity is the required input capacity for 100% rated output torque. This value takes into account the efficiency when using the FINE CYCLO as a reducer.

2. Maximum allowable input speed and allowable average input speed (Table 3)

Although use is possible within the range of the maximum allowable input speed, the allowable average input speed is limited by the operation cycle (% ED).

See P17 Formula 10 for % ED.

3. Allowable peak torque at acceleration and deceleration (Table 4)

Allowable peak torque tolerance applied to the output flange during normal start and stop.

4. Allowable maximum momentary torque (Table 4)

Allowable maximum momentary torque applied instantaneously to the output shaft due to emergency stop, external heavy shock, etc.

This indicates the value in the case of 10^3 times of application during the entire lifetime.

5. Moment of inertia (Table 3)

Indicates the value of the moment of inertia on input shaft (high speed shaft) of each model. When converting these values to inertia (kgf.m.sec^2), divide by g (9.8 m/sec^2).

6. Use the following formula to complement the rated torque for speeds not shown in the table.

$$T_N = T_{1750} \left(\frac{1750}{N} \right)^{0.3}$$

T_N : Rated torque for input speed N
 T_{1750} : Rated torque at input speed of 1750 r/min

8. Engineering Data

8-1. Stiffness and Lost Motion

- Hysteresis curve: Relationship between the load unloaded slowly to zero torque after fixing the input shaft (high-speed shaft) and slowly applying torque up to the rating to the output flange, and the torsion angle of the output flange
- Lost motion: Torsion angle under the load of the rating torque $\times \pm 3\%$
- Stiffness: Inclination of the straight line between two points on the hysteresis curve: the points of rated torque $\times 50\%$ and 100%

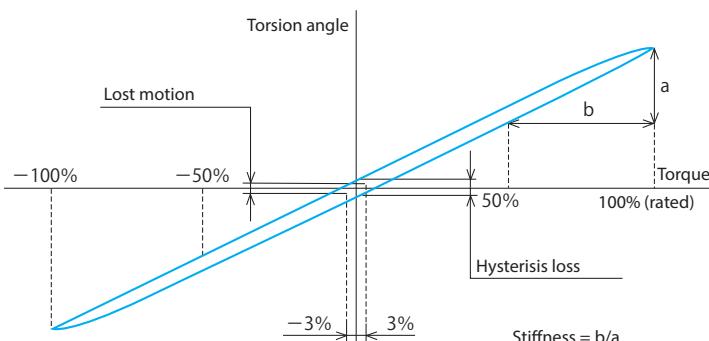

Figure 3. Hysteresis curve

Table 5. Performance values

Frame size	Reduction ratio	Lost motion		Stiffness N · m/arc min
		Measurement torque(\pm) N · m	Lost motion arc min

	59	58.9		
	89	52.1		
	119	48.0		

Note: arc min indicates the angle "minute."

The stiffness indicates the average value (representative value).

8-2. No Load Running Torque

No load running torque means the torque on the high speed shaft side required to rotate the reducer without a load.

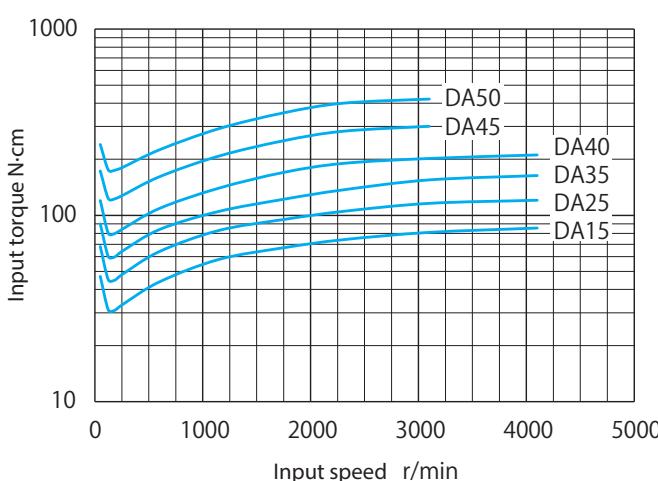

Figure 4

Note: 1. Figure 4 shows the average value after running-in.

2. Measurement conditions

Ring gear housing temperature	Approx. 30°C
Dimensional precision in assembly	See section 11-1.
Lubrication	Sumitomo standard grease

8-3. No Load Friction Torque on Output Shaft

The no load friction torque on output shaft indicates the torque required to start rotation from the output side of reducer without load.

Table 6. No load friction torque values

Frame size	No load friction torque on output shaft N · m
DA15	34
DA25	60

8-4. Efficiency

Figure 5. Efficiency curve

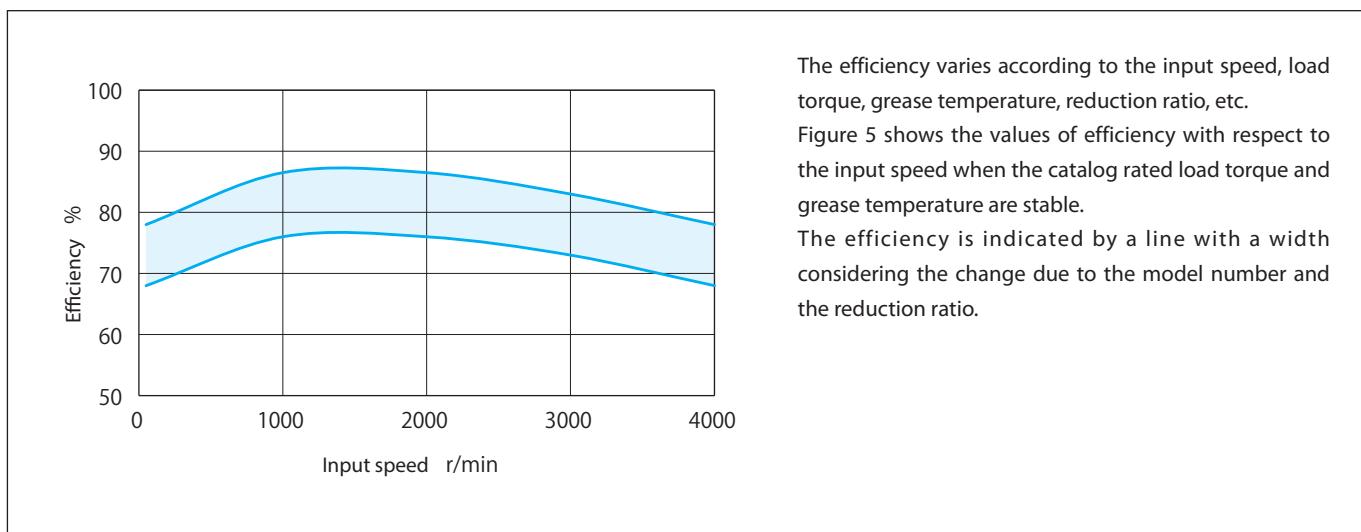

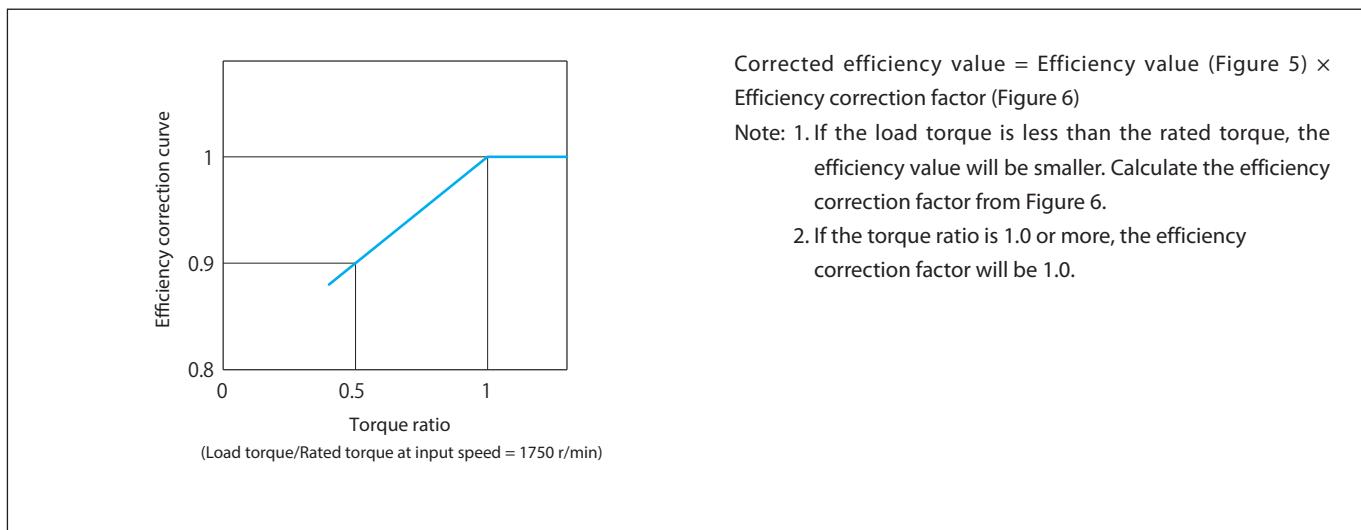

Figure 6. Efficiency correction curve

8-5. High Speed Shaft Radial Load and Axial Load

When mounting a gear or pulley on a high speed shaft, use the reducer within a range where the radial load and axial load do not exceed the allowable values.

Check the radial load and axial load of the high speed shaft according to the following formulas ((1) to (3)).

(1) Radial load P_r

$$P_r = \frac{T\ell}{R} \leq \frac{P_{ro}}{L_f \cdot C_f \cdot F_{s1}} \quad (\text{Formula 1})$$

(2) Axial load P_a

$$P_a \leq \frac{P_{ao}}{C_f \cdot F_{s1}} \quad (\text{Formula 2})$$

(3) When a radial load and axial load coexist

$$\left(\frac{P_r \cdot L_f}{P_{ro}} + \frac{P_a}{P_{ao}} \right) \cdot C_f \cdot F_{s1} \leq 1 \quad (\text{Formula 3})$$

P_r : Actual radial load (N)

$T\ell$: Actual transmission torque on high speed shaft of reducer (N.m)

R: Pitch circle radius of sprocket, gear, pulley, etc. (m)

P_{ro} : Allowable radial load (N) (Table 7)

P_a : Actual axial load (N)

P_{ao} : Allowable axial load (N) (Table 8)

L_f : Load position factor (Table 9)

C_f : Coupling factor (Table 10)

F_{s1} : Shock factor (Table 11)

Table 7. Allowable radial load P_{ro} (N)

Frame size	Input speed r/min								
	4000	3000	2500	2000	1750	1500	1000	750	600

DA50				657	687	726	824	912	981

Use the following formula to complement the allowable radial load for rotation speeds not shown in the table.

$$P_{rN} = P_{r1750} \left(\frac{1750}{N} \right)^{1/3}$$

P_{rN} : Allowable radial load for input speed N

P_{r1750} : Allowable radial load at an input speed of 1750 r/min

Table 8 Allowable axial load P_{ao} (N)

Frame size	Input speed (r/min)									
	4000	3000	2500	2000	1750	1500	1000	750	600

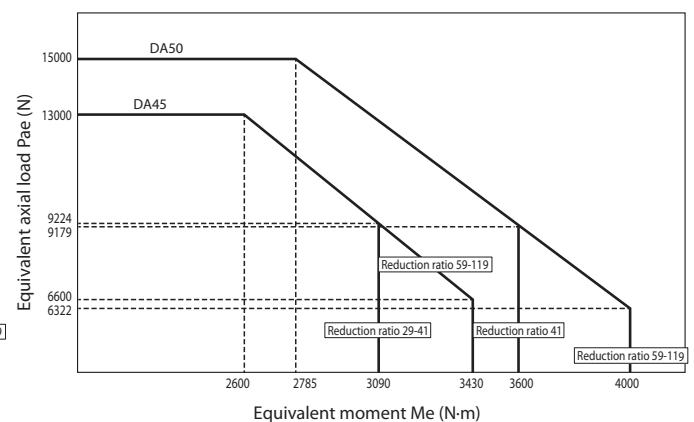

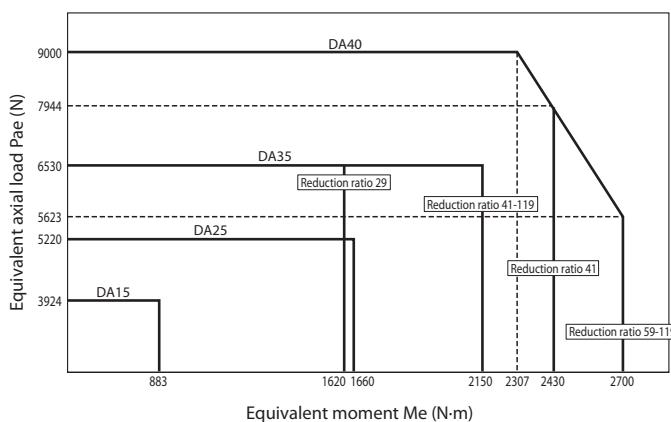

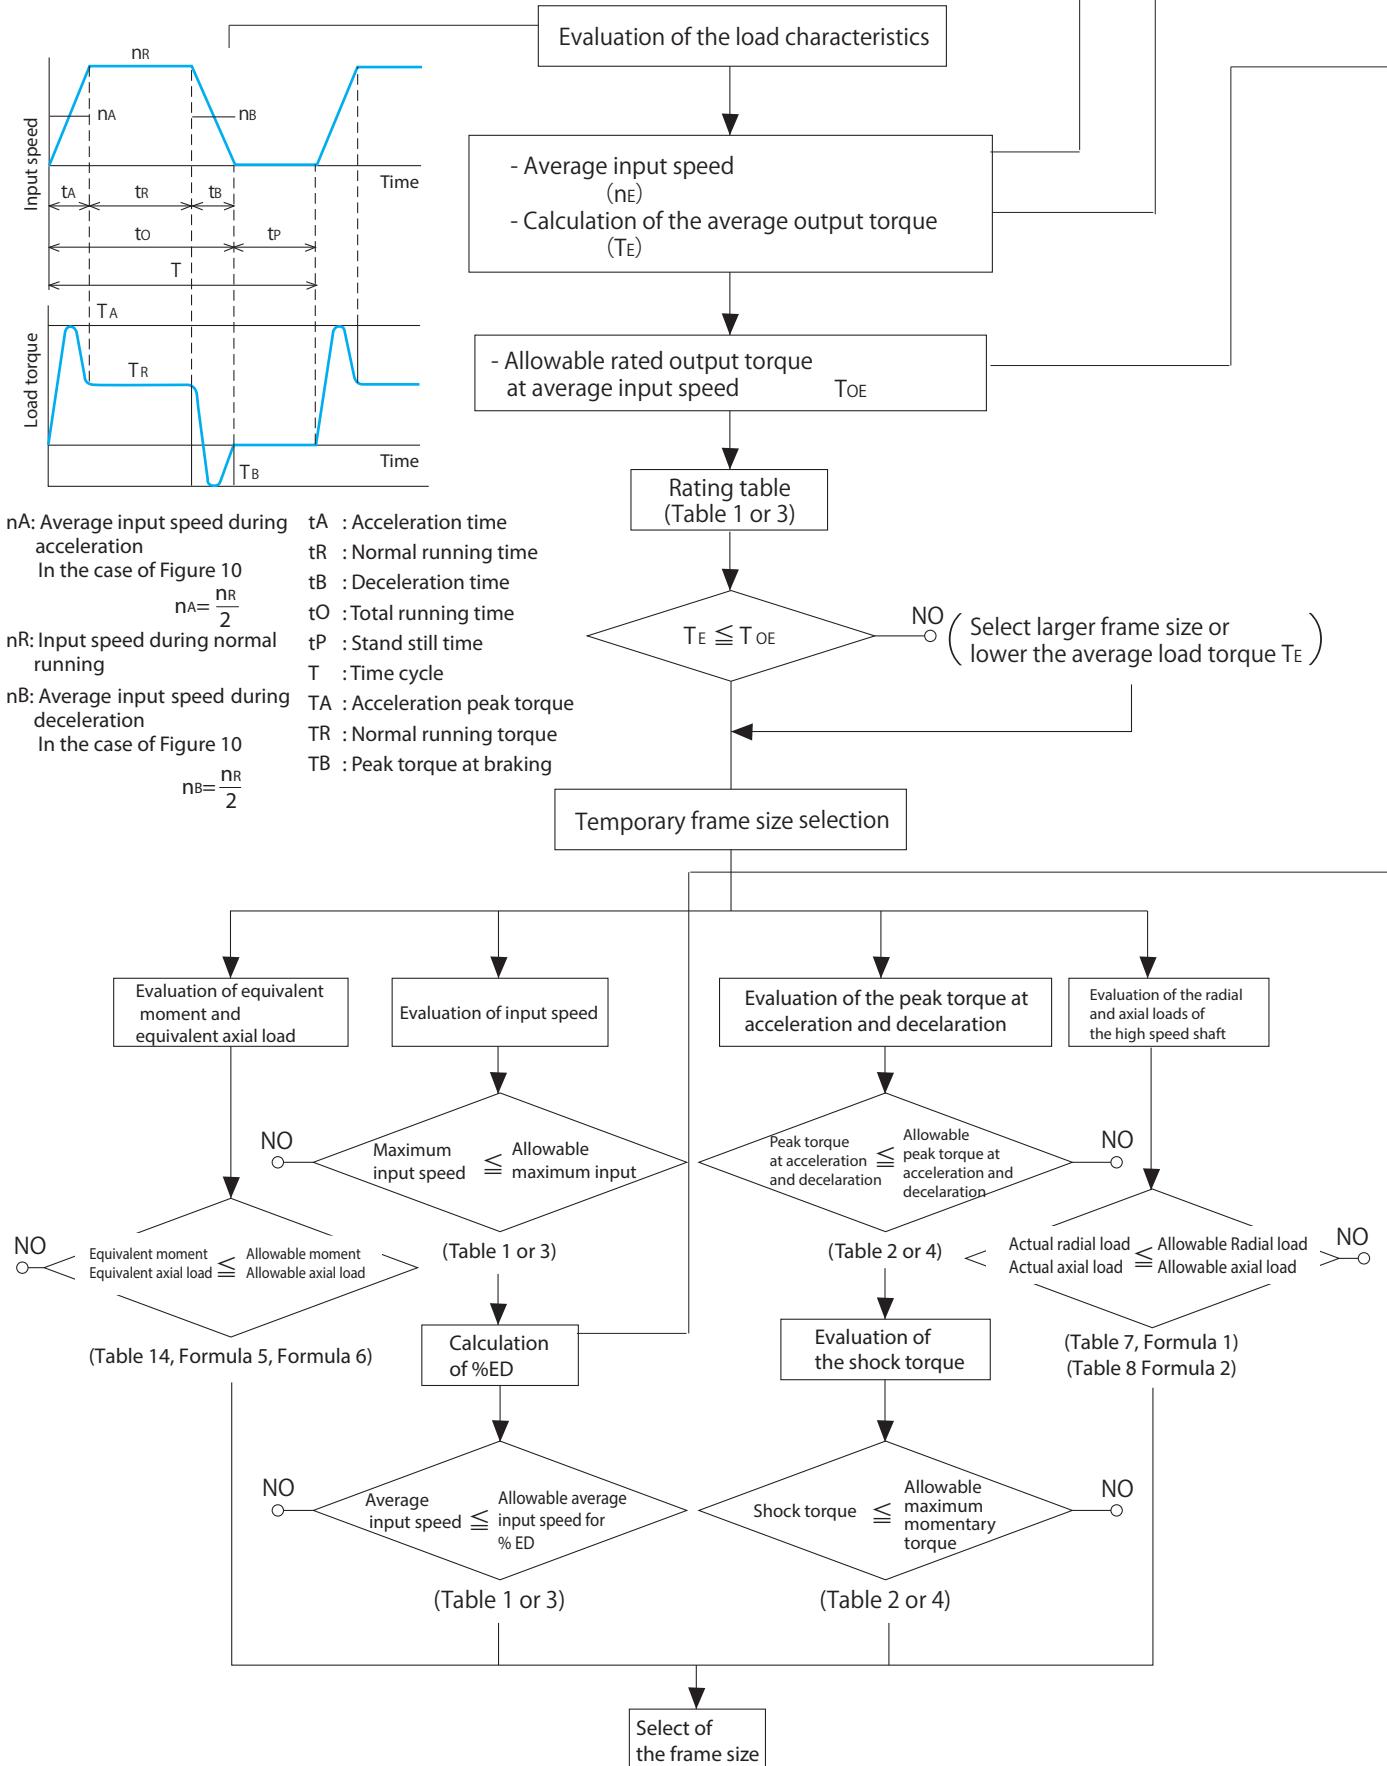

Figure 9. Allowable moment and axial load diagram

10. Selection

10-1. Selection Flow Chart and Calculation Formula

Figure 10 Load pattern

Calculation for the load pattern in Figure 10

Average input speed $n_E = \frac{t_A \cdot n_A + t_R \cdot n_R + t_B \cdot n_B}{t_0}$ (Formula 7)

Average load torque $T_E = \left(\frac{t_A \cdot n_A \cdot T_A^{10/3} + t_R \cdot n_R \cdot T_R^{10/3} + t_B \cdot n_B \cdot T_B^{10/3}}{t_0 \cdot n_E} \right)^{0.3} \times F_{S2}$ (Formula 8)

Allowable rated torque at average input speed $T_{OE} = \left(\frac{600}{n_E} \right)^{0.3} \times T_0$ (Formula 9)

To: Rated at 600 r/min (Table 3)

For a reduction ratio of 41 to 119, when $n_E < 600$ r/min, T_{OE} should be rated at 600 r/min (To).

For a reduction ratio of 29, when $n_E < 435$ r/min, T_{OE} should be rated at output speed 15 r/min (To).

%ED $\% ED = \frac{t_0}{T} \times 100$ (Formula 10)

The maximum operation cycle for calculating % ED is 10 minutes. If this is exceeded, calculate as $T = 10$ (minutes).

Table 17 F_{S2} load factor

Load conditions	F_{S2}
Uniform load (No shock)	1
Moderate shock	1-1.2
Heavy shock	1.4-1.6

10-2. Selection Example

Make confirmation assuming F4CF-DA25-119 for the following specifications.

(Specifications) T_A : Acceleration peak torque 700N·m

t_A : Acceleration time 0.3s

T_R : Normal running torque 300N·m

t_R : Normal running time 3.0s

T_B : Peak torque at braking 500N·m

t_B : Deceleration time 0.3s

Shock torque: 2000N·m 1000 times during the whole lifetime

t_P : Stand still time 3.6s

n_A : Average input speed during acceleration 1250 r/min

t_0 : Total running time 3.6s

n_R : Input speed during normal running 2500 r/min

T : Time cycle 7.2s

n_B : Average input speed during deceleration 1250 r/min

High speed shaft radial load: Timing belt driven, small shock, 196N at a position 25 mm from the shaft end

Low speed shaft radial load: Gear coupling, small shock, 5800N at a position 60 mm from the flange surface

With almost no shock.

(Calculation) Average input speed $n_E = \frac{0.3 \times 1250 + 3.0 \times 2500 + 0.3 \times 1250}{3.6} = 2292$ (r/min)

Average load torque $T_E = \left(\frac{0.3 \times 1250 \times 700^{10/3} + 3.0 \times 2500 \times 300^{10/3} + 0.3 \times 1250 \times 500^{10/3}}{3.6 \times 2292} \right)^{0.3} \times 1 = 365$ N·m)

Allowable rated torque at average input speed $T_{OE} = \left(\frac{600}{2292} \right)^{0.3} \times 571 = 382$ (N·m) ≥ 365 (N·m) -> F4CF-DA25-119 selected as temporary frame size.

%ED calculation $\% ED = \frac{3.6}{7.2} \times 100 = 50\%$

Check of maximum input speed 2500 (r/min) < 5050 (r/min) (Table 1 or 3)

Check of average input speed 2292 (r/min) at 50% ED < 4200 (r/min) at 50% ED (Table 1 or 3)

Check of peak torque at acceleration/deceleration 700 (N·m) < 1029 (N·m) (Table 2 or 4)

Check of shock torque 2000 (N·m) < 2058 (N·m) (Table 2 or 4)

High speed shaft allowable radial load considering the factors

$Pro = 402N = 441 \times (1750/2292)^{1/3}$, $Lf = 1.25$, $Cf = 1.25$, $F_{S1} = 1.2$

$\frac{Pro}{Lf \times Cf \times F_{S1}} = \frac{402}{1.25 \times 1.25 \times 1.2} = 214$ (N) > 196 (N) (Table 7, Formula 1)

Check of allowable moment

$Lr = 60 + L1 - a = 60 + 139 - 30.5 = 168.5$ (mm)

External moment with factors taken into consideration

$Cf = 1.25$, $F_{S1} = 1.2$, $M = Cf \times F_{S1} \times Pro \times Lr = 1.25 \times 1.2 \times 5800 \times 168.5 \times 10^{-3} = 1466$ (N·m) < 1660 (N·m)

F4CF-DA25-119 is selected based on the above consideration.

11. Notice for Designing

11-1. Assembly Method and Dimensional precision in assembly

Figure 11 Assembly Method

- The input parts such as motors shall be assembled referring to ③spigot C in the figure below.
- Use spigot B for the assembly of the output flange, and use spigot A for assembly of the ring gear housing. ④⑤

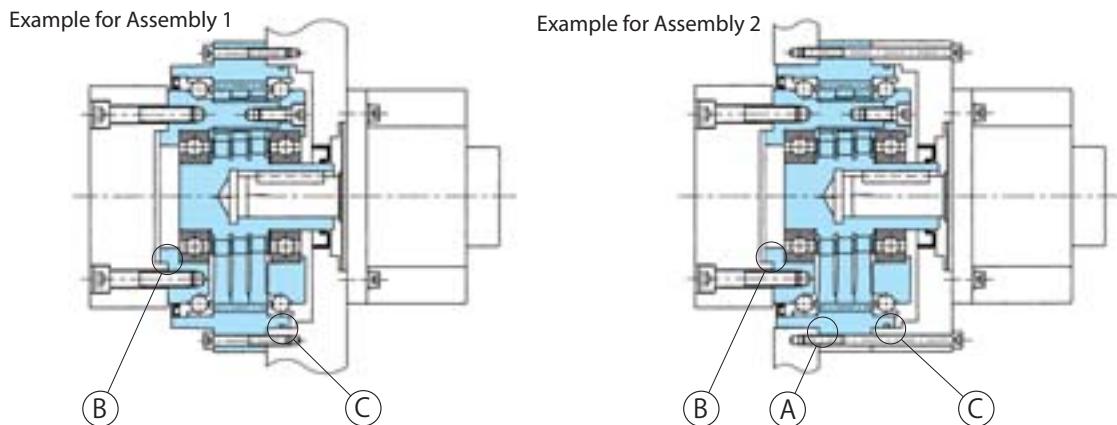

Figure 12. Dimensional precision in assembly

11-2. Bolt Tightening Torque and Allowable Transmission Torque

(1) Allowable transmission torque by bolt

Table 19 shows the number, size and tightening torque of bolts when fastening the output flange and reduction gear of the FINE CYCLO with bolts. At this time, it is possible to transmit the allowable transmission torque shown in Table 19.

Table 19

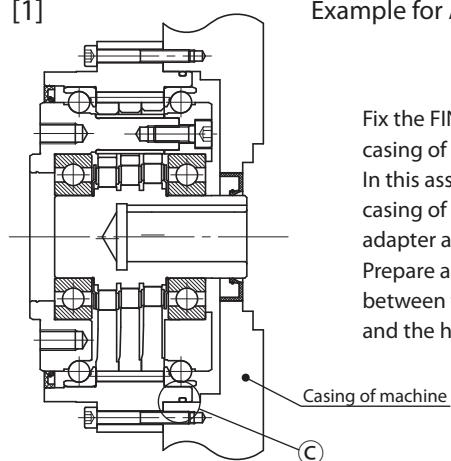

Frame size	Tightening of the output flange				Tightening of the reducer part			
	Number and size of bolts	Bolt PCD mm	Bolt tightening torque N · m	Allowable transmission torque by bolt N · m	Number and size of bolts	Bolt PCD mm	Bolt tightening torque N · m	Allowable transmission torque by bolt N · m
DA15	12-M8	68	38.3	1478	16-M5	123.5	9.1	1389
DA25	18-M8	85	38.3	2772	16-M6	148	15.7	2356
DA35	16-M10	100	76.5	4594	16-M8	175	38.3	5073
DA40	16-M10	115	76.5	5283	18-M8	184	38.3	6000
DA45	18-M10	124	76.5	6408	16-M10	204	76.5	9371
DA50	18-M12	140	133	10516	16-M10	220	76.5	10106

- Bolt: Use hexagon socket head bolts of strength class 12.9 of JIS B 1176.
- Seat scratch prevention measure: Use conical spring washers (JIS B 1252, class 2) when tightening the reducer part.
- Locking measure: use adhesive (Loctite 262, etc) in addition to conical spring washers as mentioned above.
- Coefficient of friction: 0.15

11-3. Assembly Procedure

[1]

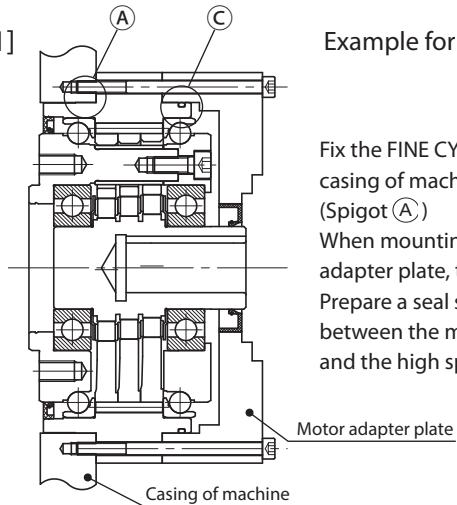

Example for Assembly 1

Fix the FINE CYCLO to the casing of machine with bolts. In this assembly example, the casing of machine and motor adapter are shared. Prepare a seal structure between the motor adapter and the high speed shaft.

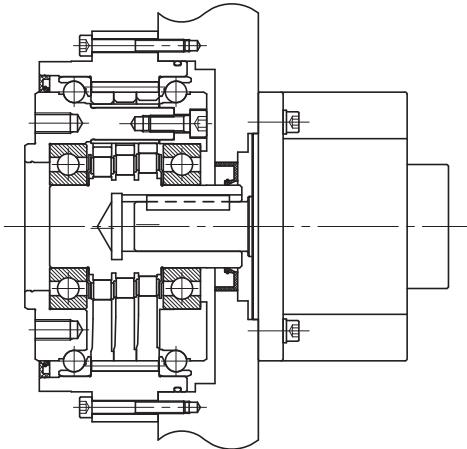

[1]

Example for Assembly 2

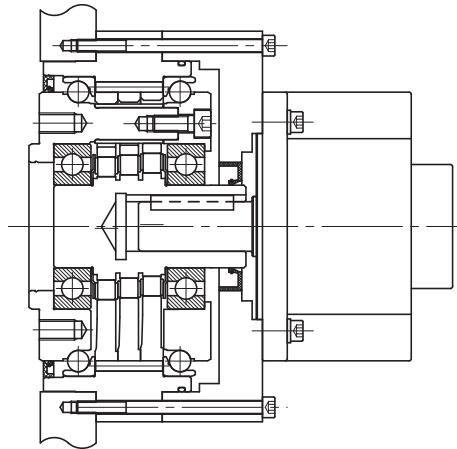

Fix the FINE CYCLO to the casing of machine with bolts. (Spigot (A)) When mounting the motor adapter plate, tighten together. Prepare a seal structure between the motor adapter and the high speed shaft.

[2]

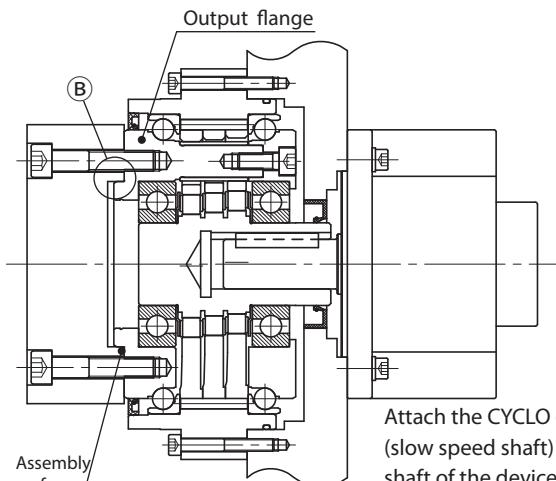

Align the key phase of the motor shaft and the high speed shaft of the FINE CYCLO and fix the motor to the FINE CYCLO with bolts. (When mounting the servo motor, apply anti-fretting agent beforehand to the servo motor shaft.)

[2]

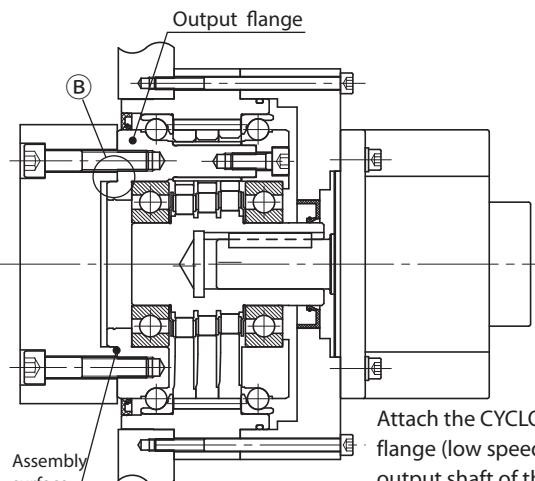

Align the key phase of the motor shaft and the high speed shaft of the FINE CYCLO and fix the motor to the FINE CYCLO with bolts. (When mounting the servo motor, apply anti-fretting agent beforehand to the servo motor shaft.)

[3]

Attach the CYCLO output flange (slow speed shaft) to the output shaft of the device with bolts. (Spigot (B)) At this time, apply liquid gasket to the assembly surface.

[3]

Attach the CYCLO output flange (low speed shaft) to the output shaft of the device with bolts. (Spigot (B)) At this time, apply liquid gasket to the assembly surface.

Figure 13. Assembly Procedure

- Notes:
1. The bolts for mounting of the gear reducer shall be fastened by the specified fastening torque (See Table 19).
 2. When mounting the output shaft of the device to the FINE CYCLO output flange (low speed shaft) with bolts, set the length of the bolts to be shorter than the screw depth shown in the output flange of the outline drawing (P21 to 26).

Recommended liquid gasket: ThreeBond Co., Ltd., Liquid gasket ThreeBond 1215

11-4. Lubrication

- For this drive, no grease is filled before shipment, so be sure to prepare the recommended grease (Table 20) and fill the specified filling quantity (Table 21) before operation.
The specified filling quantity is for the drive space. Also fill the device-side space (① and ②) with grease.

Horizontal mounting: Fill about 70% to 80% of the volume of device-side space ①, ② with grease.

Vertical mounting (1): Fill grease for the volume of device-side space ②.
To prevent rise in the internal pressure, secure about 10 to 20% space of the overall volume (drive space + device-side space ① + device-side space ②) in the device-side space ①).

Vertical mounting (2): Fill grease for the volume of device-side space ①.
To prevent rise in the internal pressure, secure about 10 to 20% space of the overall volume (drive space + device-side space ① + device-side space ②) in the device-side space ②). Excessive grease filling causes rise in the internal pressure, which causes grease leak and oil seal detachment.

- The specified filling quantity shown in Table 21 is a guideline so confirm the grease level when filling grease.
- For the grease fill position of the output side, see the A dimensions shown in the table.
- In the initial installation, fill grease from the lower grease fill and discharge hole and surely fill inside the drive with grease.
- Replace grease every 20,000 hours of operation time or every three to five years.

12. Outline Drawing

F4CF-DA15 Outline Drawing

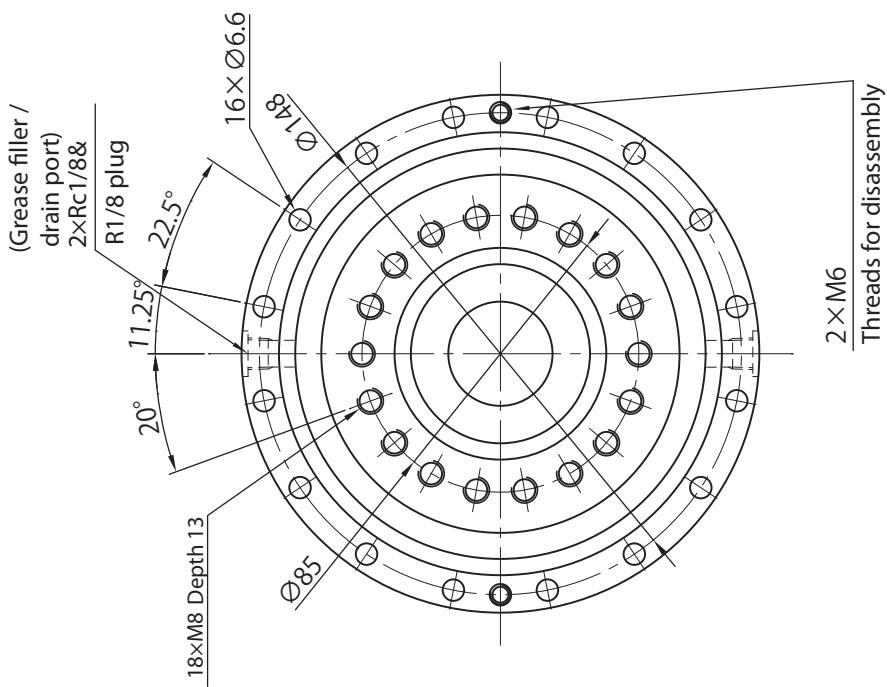

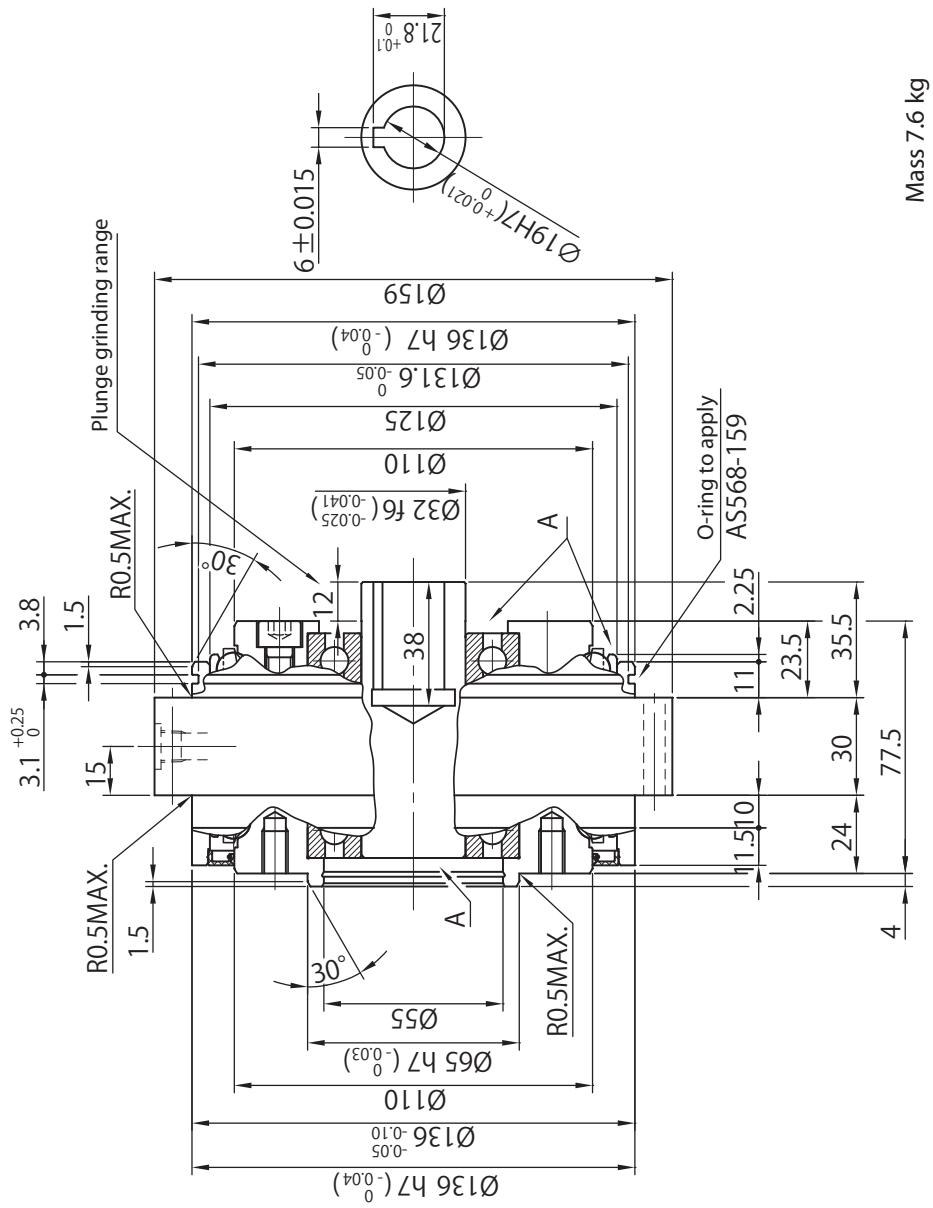

- Part A is not grease sealed.
- Be sure to prepare the sealing structure.
- No paint in the standard specification.

* High speed shaft hollow diameter is available up to Ø14 (key 5 x 5).

F4CF-DA25 Outline Drawing

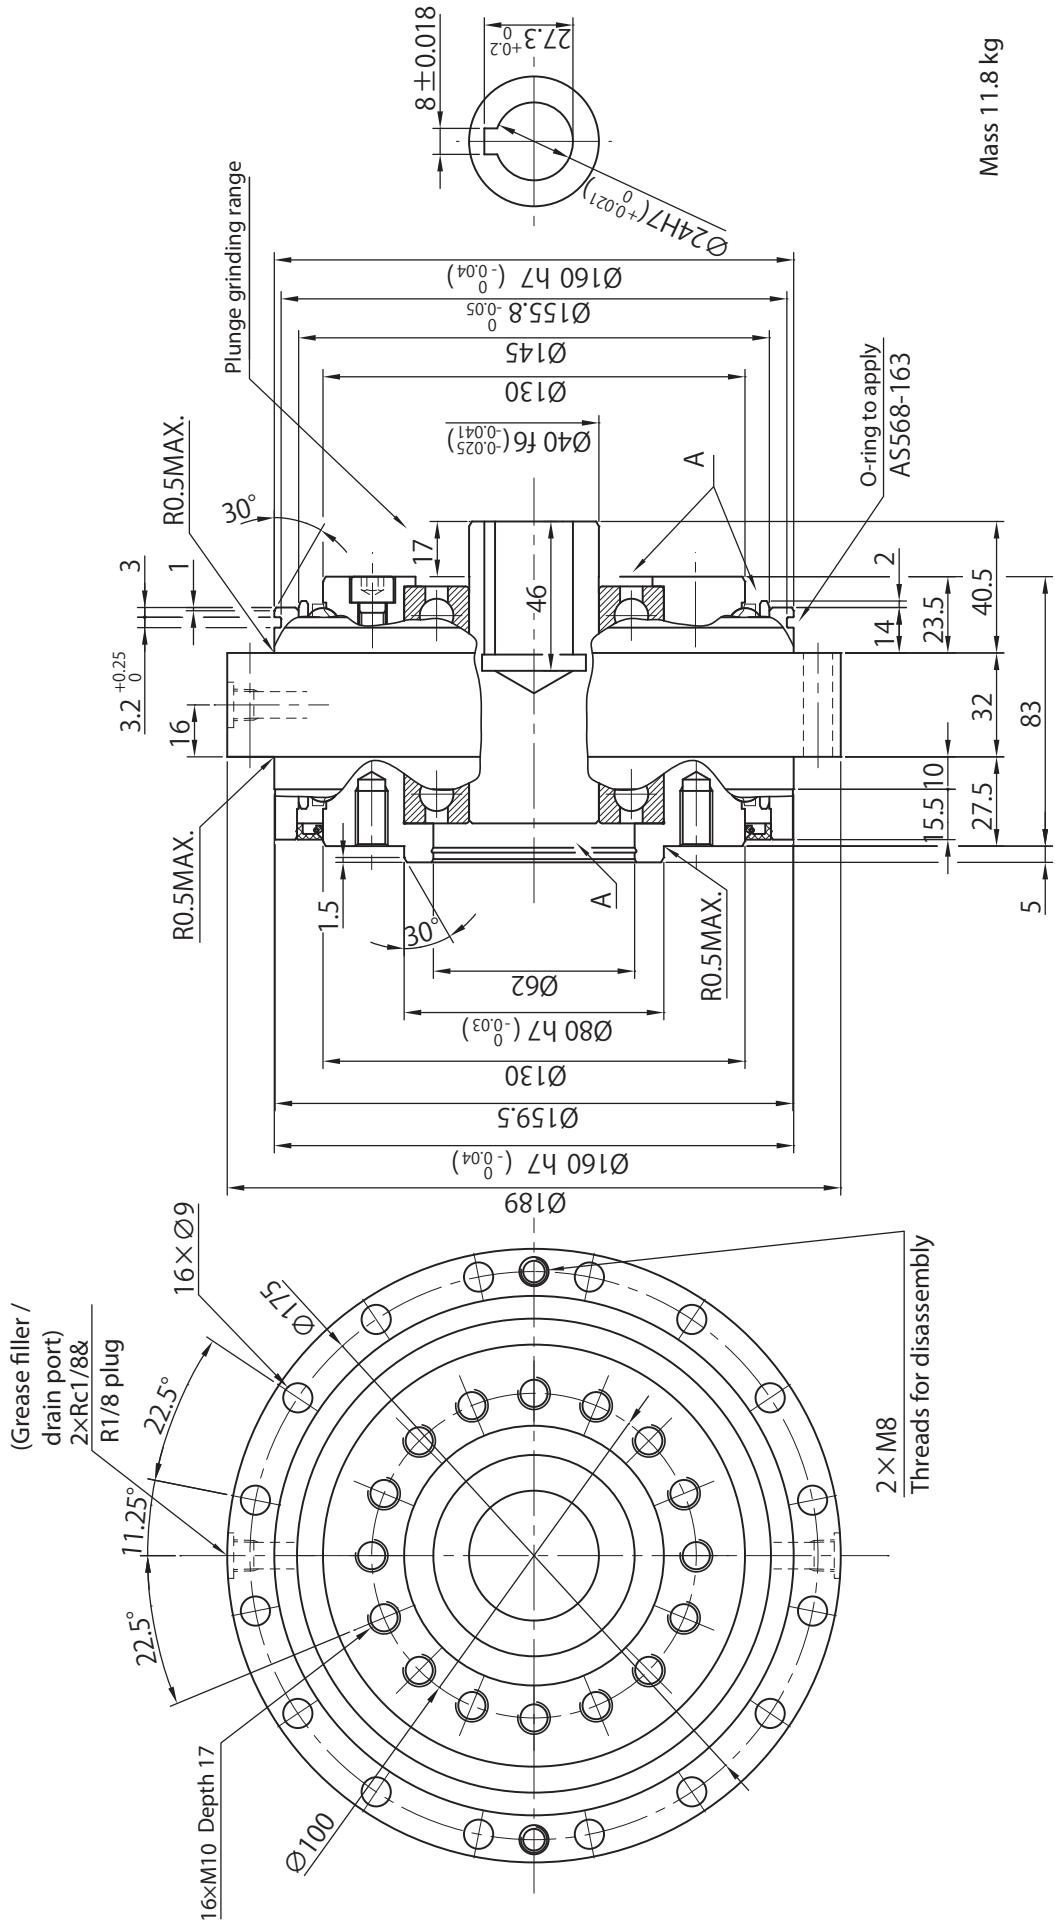

- Part A is not grease sealed.
Be sure to prepare the sealing structure.
- No paint in the standard specification.

* High speed shaft hollow diameter is available up to $\Phi 20$ (key 6×6).

F4CF-DA35 Outline Drawing

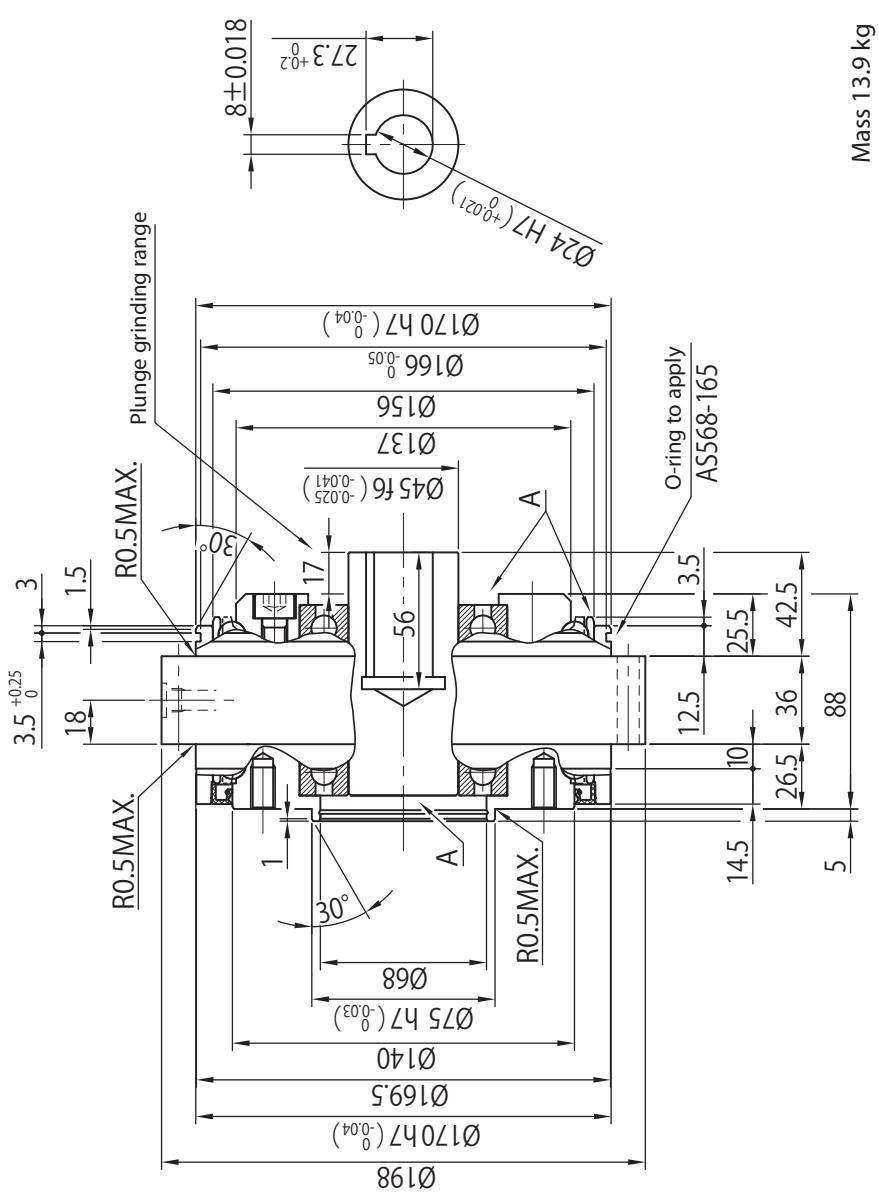

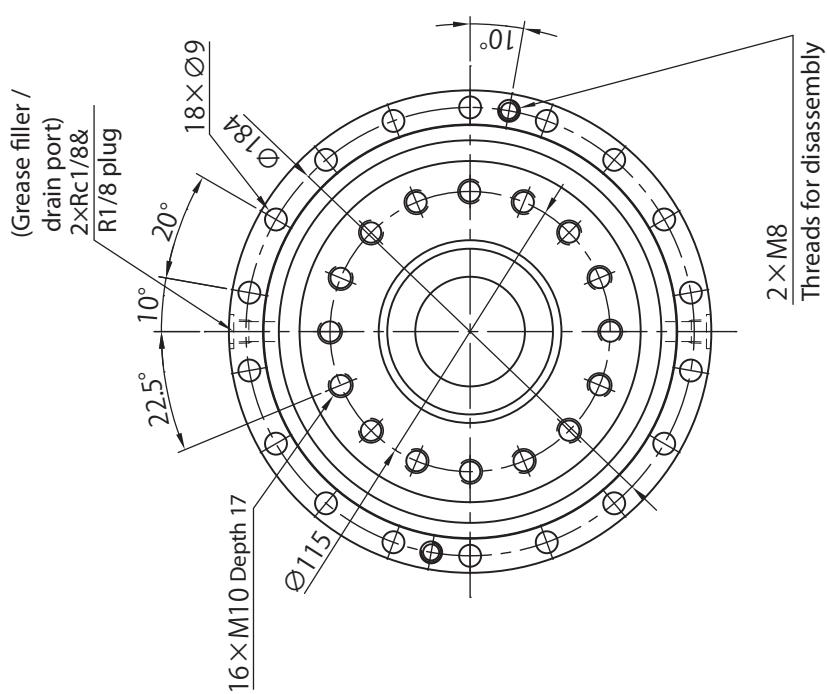

- Part A is not grease sealed.
 - Be sure to prepare the sealing structure.
 - No paint in the standard specification.

* High speed shaft hollow diameter is available up to Ø27 (key 8 x 7).

F4CF-DA40 Outline Drawing

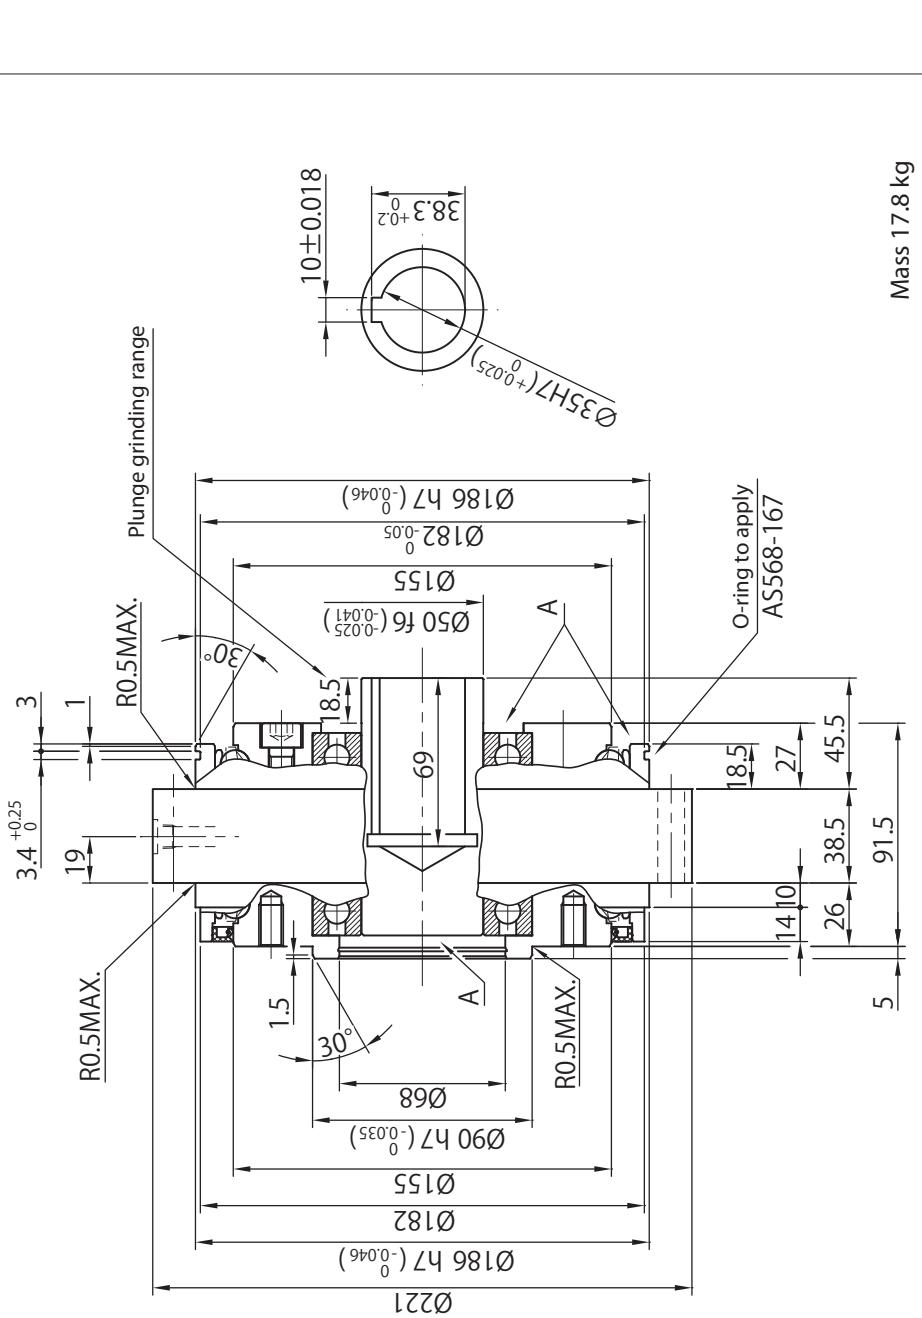

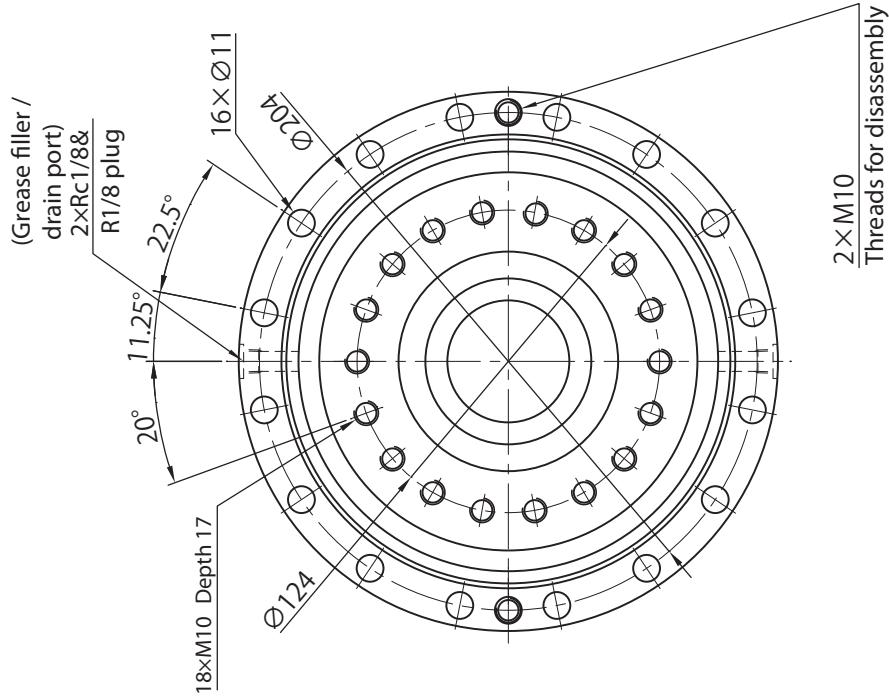

- Part A is not grease sealed.
- Be sure to prepare the sealing structure.
- No paint in the standard specification.

* High speed shaft hollow diameter is available up to Ø32 (key 10 x 8).

F4CF-DA45 Outline Drawing

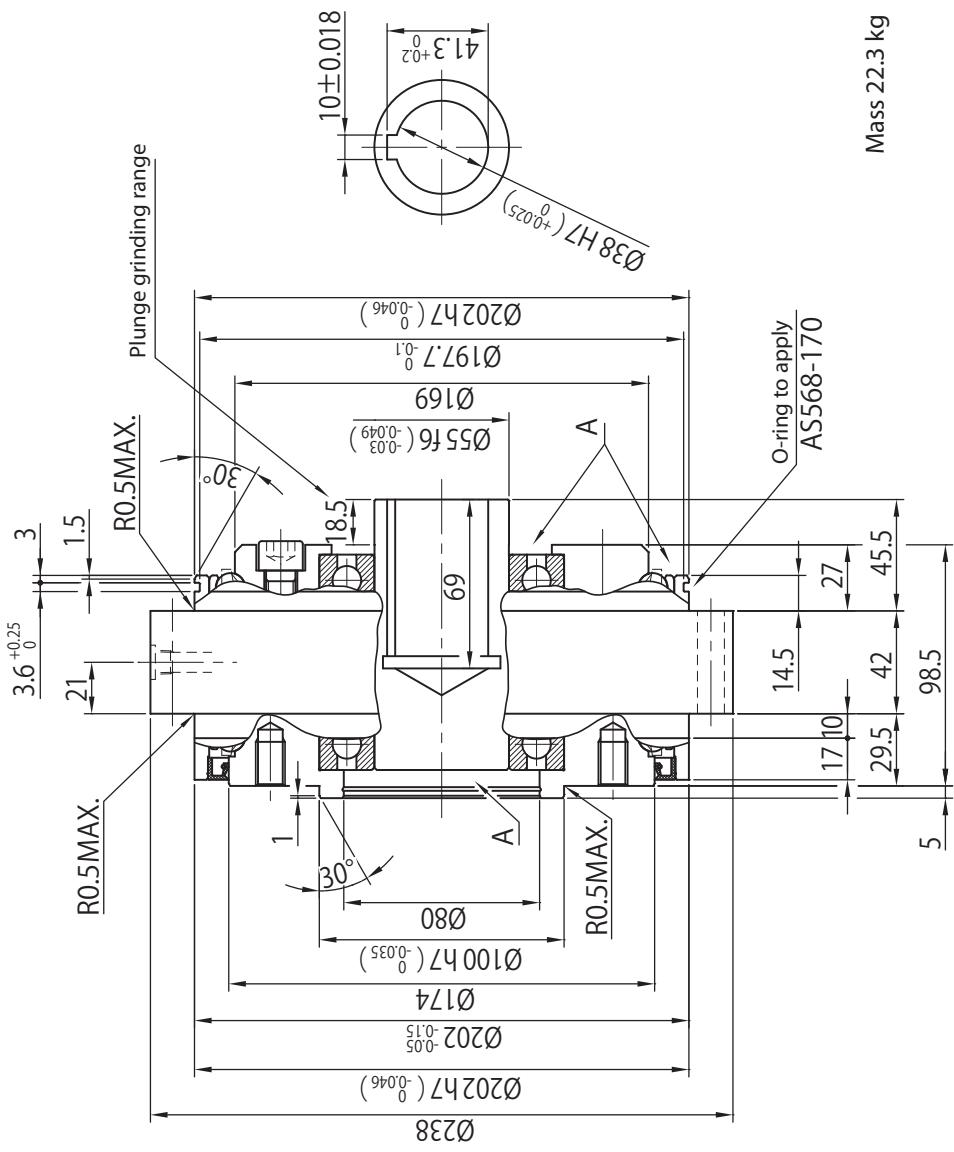

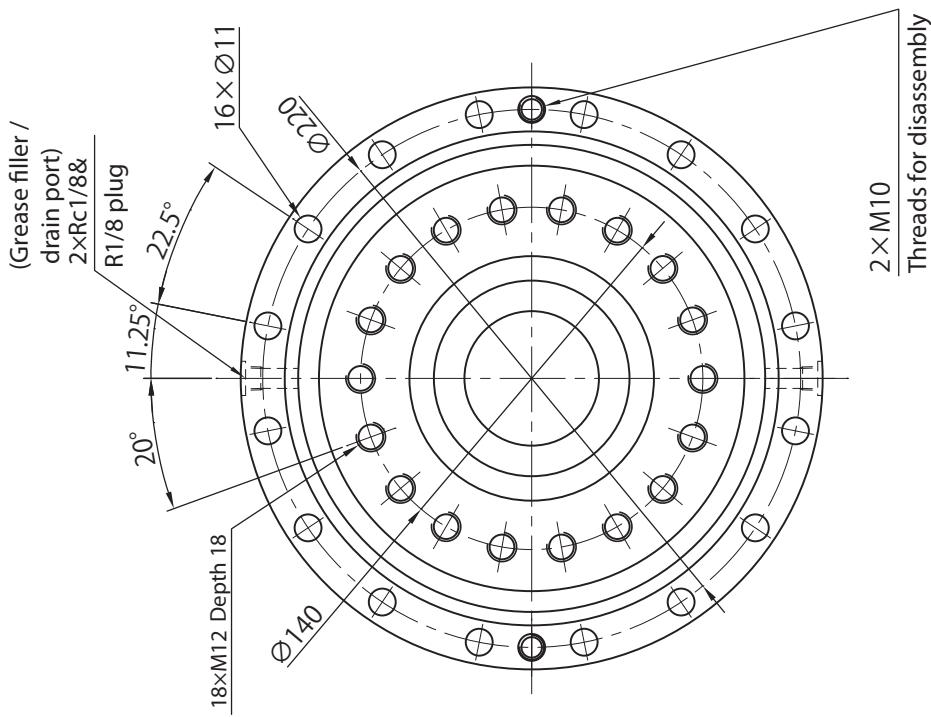

- Part A is not grease sealed.
Be sure to prepare the sealing structure.
- No paint in the standard specification.

* High speed shaft hollow diameter is available up to Ø36 (key 10 x 8).

F4CF-DA50 Outline Drawing

- Part A is not grease sealed.
- Be sure to prepare the sealing structure.
- No paint in the standard specification.

* High speed shaft hollow diameter is available up to $\Phi 41$ (key 12 x 8).

13. Working Principle

In principle, the FINE CYCLO consists of the following two mechanisms.

- ☆ Internal planetary gear mechanism with one or two teeth difference with trochoid curve tooth profile
- ☆ Constant speed internal gear mechanism with circular tooth

Figure 15 Internal planetary gear mechanism

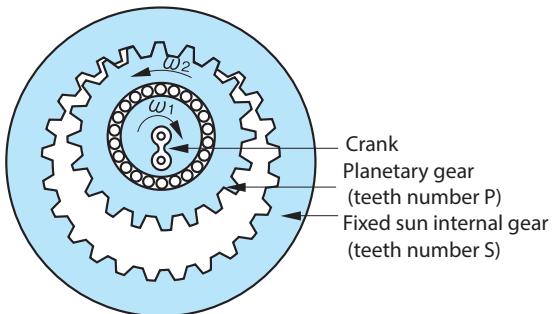

Figure 16. Planetary gear mechanism with one-tooth difference

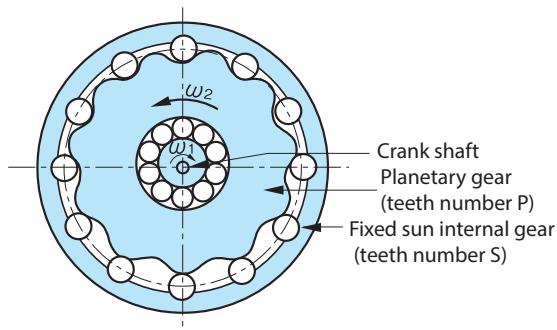

Figure 17 Constant speed gear mechanism

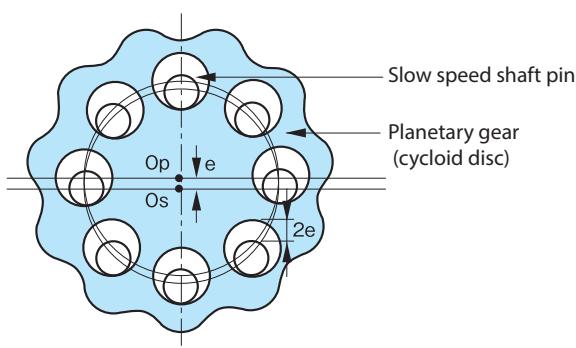

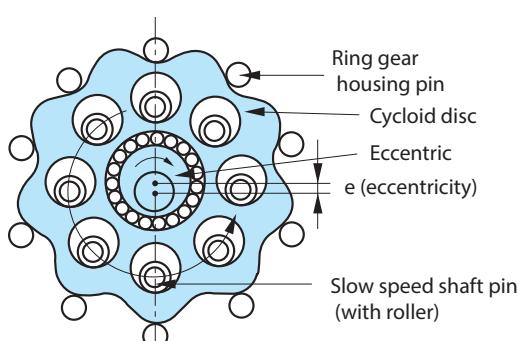

Figure 18. Structural model of the FINE CYCLO

The relationship between the angular velocities ω_1 and ω_2 is expressed by the following formula according to planetary gear theory in the internal planetary gear unit as shown in Figure 15.

$$\omega_2/\omega_1 = 1 - S/P = -(S-P)/P$$

Here, if $S-P = 1$ (tooth number difference 1), $\omega_2 / \omega_1 = -1 / P$, the rotation direction is reverse and the maximum reduction ratio can be obtained. If the common involute teeth are used, it may cause interference on the tooth tips, therefore, this mechanism cannot be used effectively with a single-tooth difference.

As shown in Figure 16, in order for the FINE CYCLO to solve this problem,

- (I) circular tooth profile in internal gear
 - (II) epitrochoidal parallel curve in the planetary gear
- are used, and an internal planetary gear with a single-tooth difference, no tooth tip interference and with unparalleled number of teeth in mesh is realized.

The planetary gear (cycloid disc) revolves at high speed (ω_1) while simultaneously rotating at low speed (ω_2).

The FINE CYCLO uses a constant speed internal gear mechanism with the circular tooth profile shown in Fig. 17 to extract only the decelerated rotation to the slow speed shaft pin. The slow speed shaft pin is arranged concentrically with the crankshaft (high speed axis) center O_s , so it is possible to easily align the high and low speed shafts by implanting this directly into the low speed shaft.

The combination of the above two mechanisms and the installation of rollers in a circular tooth profile as shown in Fig. 18 form the FINE CYCLO.

As the sliding contact is converted back to rolling contact by the rollers, mechanical loss is very small and extremely high gear efficiency is obtained.

14. Other

The specification shown in this document is based on our evaluation method. Evaluate the performance and durability in the condition of installation in the drive considering the field usage conditions, etc. and confirm that there is no problem, by yourself, before using this product.

Be sure not to perform disassembly, inspection, repair, and overhaul in cases of abnormalities of this product by yourself because they have to be performed by our skilled workers with special jigs and tools and expertise.

Note that the specifications and dimensions shown in this document may be changed without notice to customers.

Warranty standard

The scope of warranty of our delivered products is limited only to what we manufactured.

Warranty Period	The warranty period for the Products shall be 18 months after the commencement of delivery or 18 months after the shipment of the Products from the seller's works or 12 months from the Products coming into operation, whether comes first.
Warranty Condition	In the event that any problem or damage to the Product arises during the "Warranty Period" from defects in the Product whenever the Product is properly installed and combined with the Buyer's equipment or machines, maintained as specified in the maintenance manual, and properly operated under the conditions described in the catalog or as otherwise agree upon in writing between the Seller and the Buyer or its customers; the Seller will provide, at its sole discretion, appropriate repair or replacement of the Product without charge at a designated facility, except as stipulated in the "Warranty Exclusions" as described below. However, if the Product is installed or integrated into the Buyer's equipment or machines, the Seller shall not reimburse the cost of : removal or re-installation of the Product or other incidental costs related thereto, any lost opportunity, any profit loss or other incidental or consequential losses or damages incurred by the Buyer or its customers.
Warranty Exclusions	Notwithstanding the above warranty, the warranty as set forth herein shall not apply to any problem or damage to the Product that is caused by : 1. installation, connection, combination or integration of the Product in or to the other equipment or machine that is rendered by any person or entity other than the Seller ; 2. insufficient maintenance or improper operation by the Buyer or its customers, such that the Product is not maintained in accordance with the maintenance manual provided or designated by the Seller ; 3. improper use or operation of the Product by the Buyer or its customers that is not informed to the Seller, including, without limitation, the Buyer's or its customers, operation of the Product not in conformity with the specifications, or use of lubricating oil in the Product that is not recommended by the Seller ; 4. any problem or damage on any equipment or machine to which the Product is installed, connected or combined or on any specifications particular to the Buyer or its customers ; 5. any changes, modifications, improvements or alterations to the Product or those functions that are rendered on the Product by any person or entity other than the Seller ; 6. any parts in the Product that are supplied or designated by the Buyer or its customers ; 7. earthquake, fire, flood, sea-breeze, gas, thunder, acts of God or any other reasons beyond the control of the Seller ; 8. normal wear and tear, or deterioration of the Product's parts, such as bearings, oil-seals ; 9. any other troubles, problems or damage to the Product that are not attributable to the Seller.

Safety Precautions

- Observe the safety rules necessary for the installation location and device in use.

(Ordinance on Industrial Safety and Health, facility's electrical codes, interior wiring code, plant explosion proofing guide, Building Standards Act, etc.)

- Select the product suitable for your operating environment and purpose.

- If you use the product for any devices for which a breakdown of the product is expected to cause a great loss of human life or facility such as systems for human transport, hoisting equipment, etc., install a protection device in the device side for safety.

- When the unit is used in food processing applications, machines for cleanroom and so on, vulnerable to oil contamination, install an oil pan or other such device to cope with oil leakage due to breakdown or failure;
